Login Page:

I have used a example database with some user details and their banking details by inserting some data into all the related tables

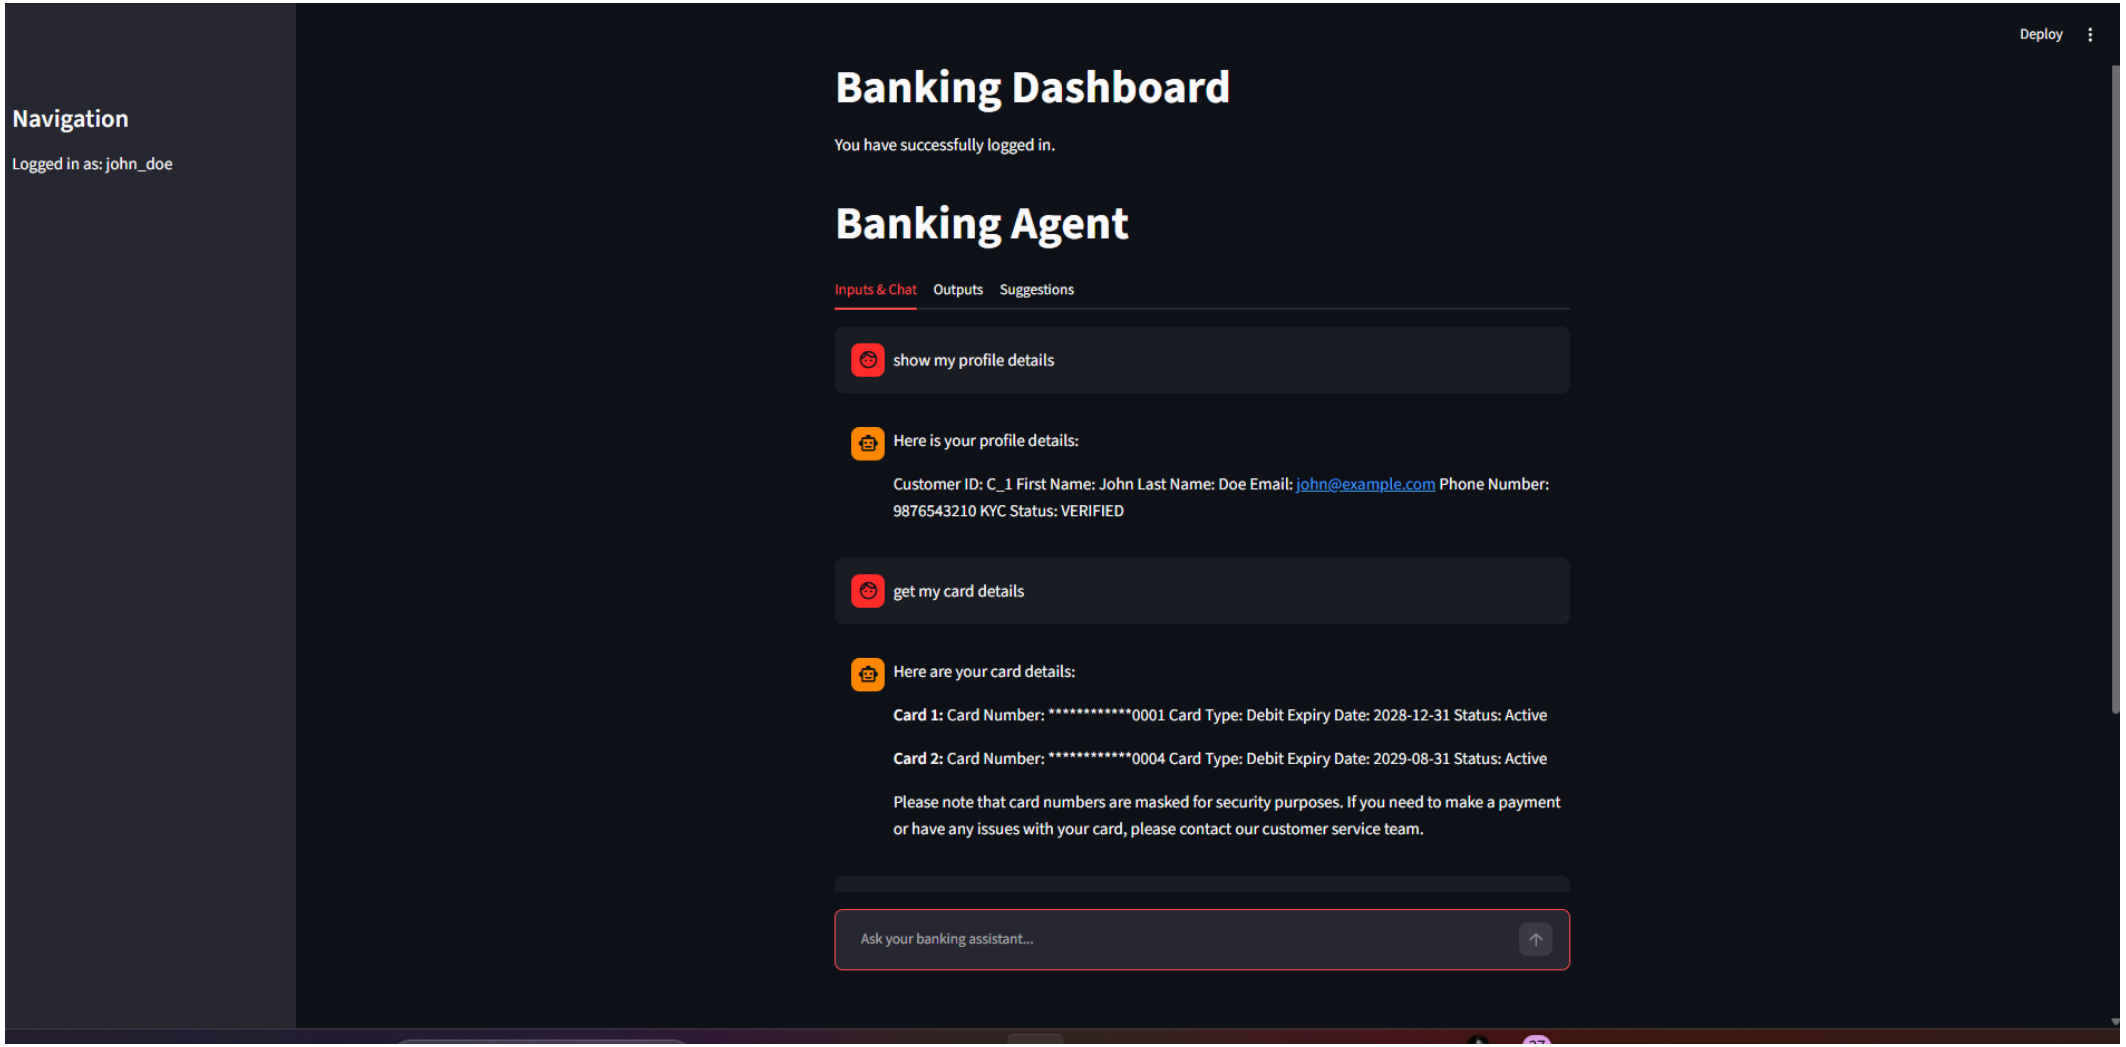

Home Page:

Currently I have logged in as Jon_doe user. This bot will give the details based on the current logged in user information

Chats:

Here we can observe the bot extracted the information from the database when we asked a query regarding profile details it has provided logged in customer details, and card details also get masked because of security reasons wehave implemented guardrails to hide the card number.

The system refuses to show details for other customers, even if that data exists. We designed it this way to ensure strict privacy, isolation, and security between customer accounts.
